

Example ‘nonmedical use’ ^{a,b}	Example ‘misuse’ ^{a,b}
<p><i>I read an article online about a new kick in Chicago and other cities about the injection of Wellbutrin—it is referred to as the poor man’s cocaine. Tried it, and had a nice euphoria with increased energy.</i></p>	<p><i>I am prescribed an antipsychotic, something for anxiety, and bupropion. I can have fun of it i just have to skip the bups and if i’m on them the anti-psychotics.</i></p>
<p><i>We have been insufflating (snorting) bups. But this has been extremely painful and Im worried its damaging my sinus/nasal cavity. I have one friend who injects them but that is not an option for the rest of us.Is there a better way to take these and still feel an effect?</i></p>	<p><i>I have also been scripted Effexor—don’t know why. I am a daily marijuana smoker and enjoy using other drugs on a recreationally. Everything from cocaine to xanax. I may want to take a scrip holiday—any thoughts on withdrawal?</i></p>
<p><i>Maybe effex? it has some opiod actions and it should be easy to get.</i></p>	<p><i>I’ve got some amitrip tablets, using them to try and help me sleep, but i cant stay asleep for longer than a few hours after taking one, and have light sleep after that, waking up all the time. I was wondering if it would be safe to take 2 or 3 of them at once to try and stay asleep for longer?</i></p>

^aPosts have been modified in non-meaningful ways to protect the identity of the author.

^bPosts were coded as nonmedical use or misuse regardless of if the action was only discussed or actually occurred.
